

**Rice Genetic Diversity Erosion:  
An Assessment Based on Virihi's Survey and Accession Records**

Debal Deb and Debdulal Bhattacharya

**Abstract**

We present here a list of folk rice varieties that were collected from farmers of eastern India during the period from 1996 to 2005, and gone out of cultivation by the year 2020. This indicates the rapid rate of the loss of rice landraces in the region.

## **Introduction**

The advent of agricultural modernisation, epitomised in India by the Green Revolution, began in the 1960s. This event introduced intensive monocultures of cereals, industrial agrochemicals, and expansion of irrigation in most of the country (Deb 2009; Nelson et al. 2019). In the process, the Green Revolution eventually replaced hundreds of folk rice varieties with modern high yielding varieties (HYVs) of rice and wheat in every state (Ahuja & Jain 2015; Nelson et al. 2019). Later, dozens of new hybrids and HYVs of different other crops dominated the market and an open supply of these seeds on the market enabled farmers to replace their own farm-saved seeds, in the hope of greater yield.

According to Richharia's (1990) estimate, more than 160,000 folk rice varieties were cultivated in India, until the onset of the Green Revolution. However, this estimate included synonyms (different names of the same landrace). After elimination of the synonyms, the number of folk rice varieties is estimated to be around 110,000 (Deb 2009), most of which are no longer being cultivated. While a large number of distinctive folk varieties are known to have disappeared from farm fields, the actual quantitative extent of the genetic diversity erosion in the case of Indian rice landraces is yet unknown. This work is an empirical assessment of the loss of folk varieties from eastern India, based on Vrihi's documentation of field accessions.

## **Materials and Methods**

Vrihi has a repertoire of 1440 of distinct folk rice varieties, collected from 12 states of India, and also from Bangladesh, Nepal, Pakistan and Sri Lanka. This accession is a result of 25 years of field explorations conducted from 1996 to 2021, and includes 567 landrace accessions from undivided Bengal (510 landraces from West Bengal and 57 from Bangladesh). The initial accession was chiefly from different districts of eastern India, numbering 416, which were characterised and published in 2005. Amongst these, 401 landraces were collected from the eastern states of Jharkhand, Odisha and West Bengal. A list of the names of the folk varieties and 35 morphological characters of each of these varieties was published in 2005 (Deb et al. 2005), which also contained a list of farmers who had donated the seed samples of these varieties. This publication shows the names of the varieties and the donor farmers' names and addresses in the states of West Bengal,

Bihar (including the region that is now Jharkhand) and Odisha. These records thus serves as a baseline data of the cultivation of varieties in eastern Indian states until 2005.

To assess the loss of the same folk varieties in subsequent years, we have used the office records of subsequent explorations by Vrihi's workers and volunteers in different districts of West Bengal, Bihar (including Jharkhand) and Odisha, and our own notes in our travel diaries from 2006 through 2022. The records of our survey and collection expeditions reveal the pattern of the loss of the folk varieties that had been collected from the same states in 2005. Table 1 shows a state-wise list of folk varieties that were collected until 2005 (and published in 2005) that are no longer cultivated in the same states as of 2020. The record of the non-availability of the varieties was surmised both from our repeated visits to the same places of original accession and from reports by other farmers and conservators in different districts of the same states.

## **Results and Discussion**

From Vrihi's accession of 401 landraces of collected from eastern Indian states during the period from 1996 to 2005, 320 are no longer being cultivated on any farm in West Bengal, Odisha and Jharkhand, as of 2020. This implies that 79.8% of Vrihi's collection were lost during the period of 15 years. The last specimens of these lost landraces are being conserved in Vrihi seed bank (<https://cintdis.org/vrihi/>).

This process of farmers' replacement of cultivars has been reported for different crops (Zeven 1999; Ahuja & Jain 2015). A major reason of this drastic reduction in the number of landraces within 15 years of our last collection is that farmers have replaced them with modern HYVs. The extinction of the landraces from farm fields implies drastic genetic erosion in rice, through the loss of important phenotypic traits, alleles and gene combinations (Ahuja & Jain 2015; Deb 2017; Khouri et al. 2021). This study indicates the alarming rapidity of rice genetic erosion in eastern India.
